EN 601.124: The Ethics of Artificial Intelligence and Automation

Department of Computer Science, March 4th 2026

Using the If X/Then Y/Leads to Z framework from lecture, reconstruct the theory of change for each of the three papers in terms of how they approach AI development.

**Cuéllar et al. focus on targeted investment,
Zaidan & Ibrahim on governance, and Sloane
et al. on participation.**

**Which theory of change do you find most
promising, and why?**

Sloane et al. argue participation isn't a design fix. What would a more robust theory of change for participatory AI look like?

**Applying the framework to domains from
Shaping Billions of Lives**

**4. Pick one healthcare milestone from
Cuéllar et al. Apply the full 6-step
deployment framework from the lecture.**

For the education/workforce domain in Cuéllar et al., apply the full 6-step deployment framework from the lecture.

What is the most important assumption in their causal chain that could break down?

For the climate domain in Cuéllar et al., write a well-scoped social problem statement. Give example of an alternative problem statement that is too vague or too narrow.

For the social media/civility domain in Cuéllar et al., write a theory of change for an AI intervention. Which stakeholders would be hardest to align, and why?
